SILICON-GERMANIUM DEVICES FOR CMOS FORMED BY ION IMPLANTATION AND SOLID PHASE EPITAXIAL REGROWTH Title:

28. (New) A semiconductor transistor formed on a silicon substrate, comprising:

a Si_{1.x}Ge_x channel region, having a germanium molar fraction of 0.2, and formed in the substrate, underneath a gate oxide and between a source region and a drain region.

(New) The transistor of claim 28, wherein the silicon/germanium (Si-Ge) semiconductor 29. transistor is a p-channel metal-oxide-semiconductor transistor.

(New) A transistor on a silicon substrate, wherein the transistor includes a channel 30. comprising a silicon-germanium (Si-Ge) allev.

(New) The transistor of claim 30, wherein the channel region has a thickness of 31. approximately 100 to 1000 ang thoms.

comprising:

(New) The transistor of claim 30, wherein, the Si-Ge alloy was formed by a process

ion implanting Ge ions through a gate oxide on the substrate at a dose of approximately 2 X 10¹⁶ atoms/cm², and wherein the Ge was implanted at an energy of approximately 20 to 100 keV; and

annealing the substrate in a furnace at a temperature of approximately 450 to 700 degrees Celsius.

(New) A p-channel metal-oxide semiconductor (PMOS) field effect transistor formed on 33. a substrate, comprising:

a silicon-germanium to silicon (Si_{1-x}Ge_x/Si) heterojunction, wherein the germanium (Ge) in the heterojunction has a molar fraction of x.

34. (New) The PMOS transistor of claim 33, wherein the Ge has a molar fraction of 0.2. Serial Number: 09/132,157 Filing Date: August 11, 1998

Title: SILICON-GERMANIUM DEVICES FOR CMOS FORMED BY ION IMPLANTATION AND SOLID PHASE EPITAXIAL REGROWTH

35. (New) The PMOS transistor of claim 33, wherein the silicon-germanium to silicon (Si_{1-x}Ge_x/Si) heterojunction includes a Si_{1-x}Ge_x channel region formed on an n-doped silicon substrate.

BI cont.

- 36. (New) The PMOS transistor of claim 33, wherein the silicon-germanium to silicon (Si_{1-x}Ge_x/Si) heterojunction includes a Si_{1-x}Ge_x channel region formed on an n-doped silicon well formed in a p-doped silicon substrate.
- 37. (New) A transistor on a silicon substrate, wherein the transistor includes a channel comprising a silicon-germanium (Si-Ge) alloy, and wherein the Si-Ge alloy was formed by a process comprising:

ion implanting germanium (Ge) ions through a gate oxide layer on the substrate at a dose of approximately 2 X 10¹⁶ atoms/cm², and wherein the Ge was implanted at an energy of approximately 20 to 100 keV; and

annealing the substrate in a furnace at a temperature of approximately 450 to 700

degrees Celsius.

Respectfully submitted,

LEONARD FORBES
